Types of Performance Testing

Load testing

- **Load testing –** It determines how the software application behaves while being accessed by multiple users simultaneously.

Stress testing

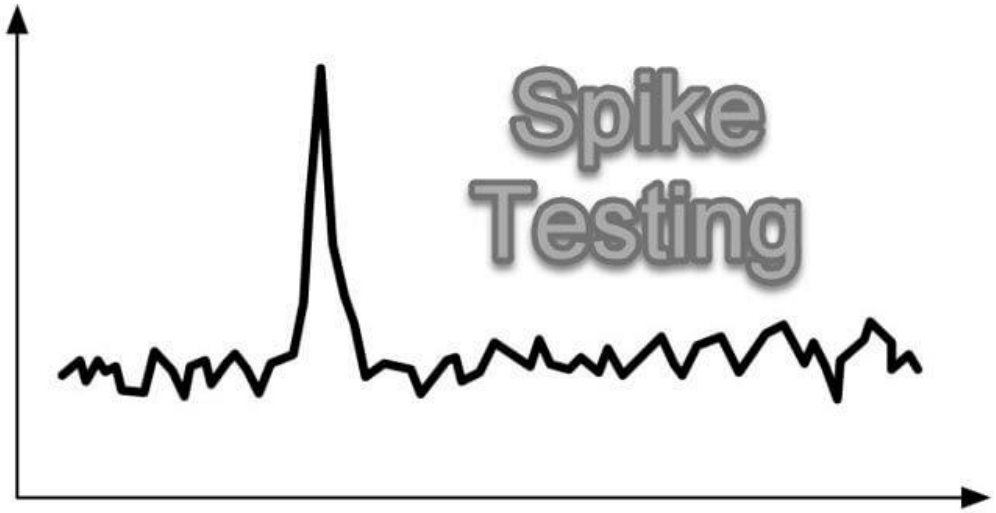
- **Stress testing –** involves testing an application under extreme workloads to see how it handles high traffic or data processing.

Endurance testing –

- **Endurance testing –** is done to make sure the software can handle the expected load over a long period of time.

Spike testing

- **Spike testing –** tests the software's reaction to sudden large spikes in the load generated by users.



Volume testing

- **Volume testing –** Under Volume Testing large amount of data is populated in a database and the overall software system's behavior is monitored.

Scalability testing

- **Scalability testing –** measures performance of a system or network when the number of user requests are scaled up or down.
